

ADMITTING DIAGNOSIS: , Kawasaki disease.,DISCHARGE
DIAGNOSIS:, Kawasaki disease, resolving.,HOSPITAL
COURSE:, This is a 14-month-old baby boy Caucasian who
came in with presumptive diagnosis of Kawasaki with fever for
more than 5 days and conjunctivitis, mild arthritis with edema,
rash, resolving and with elevated neutrophils and
thrombocytosis, elevated CRP and ESR. When he was sent
to the hospital, he had a fever of 102. Subsequently, the
patient was evaluated and based on the criteria, he was
started on high dose of aspirin and IVIG. Echocardiogram was
also done, which was negative. IVIG was done x1, and
between 12 hours of IVIG, he spiked fever again; it was
repeated twice, and then after second IVIG, he did not spike
any more fever. Today, his fever and his rash have completely
resolved. He does not have any conjunctivitis and no redness
of mucous membranes. He is more calm and quite and taking
good p.o.; so with a very close followup and a cardiac
followup, he will be sent home.,DISCHARGE ACTIVITIES:,
Ad-lib.,DISCHARGE DIET: , PO ad-lib.,DISCHARGE
MEDICATIONS: , Aspirin high dose 340 mg q.6h. for 1 day
and then aspirin low dose 40 mg q.d. for 14 days and then
Prevacid also to prevent his GI from aspirin 15 mg p.o. once a
day. He will be followed by his primary doctor in 2 to 3 days.
Cardiology for echo followup in 4 to 6 weeks and instructed
not to give any vaccine in less than 11 months because of
IVIG, all the live virus vaccine, and if he gets any rashes, any
fevers, should go to primary care doctor as soon as possible.
