

SUBJECTIVE:, The patient has recently had an admission for pneumonia with positive blood count. She was treated with IV antibiotics and p.o. antibiotics; she improved on that. She was at home and doing quite well for approximately 10 to 12 days when she came to the ER with a temperature of 102. She was found to have strep. She was treated with penicillin and sent home. She returned about 8 o'clock after vomiting and a probable seizure. Temperature was 104.5; she was lethargic after that. She had an LP, which was unremarkable. She had blood cultures, which have not grown anything. The CSF has not grown anything at this point.,**PHYSICAL EXAMINATION:**, She is alert, recovering from anesthesia. Head, eyes, ears, nose and throat are unremarkable. Chest is clear to auscultation and percussion. Abdomen is soft. Extremities are unremarkable.,**LAB STUDIES:** , White count in the emergency room was 9.8 with a slight shift. CSF glucose was 68, protein was 16, and there were no cells. The Gram-stain was unremarkable.,**ASSESSMENT:** , I feel that this patient has a febrile seizure.,**PLAN:** , My plan is to readmit the patient to control her temperature and assess her white count. I am going to observe her overnight.
